STATE STREET

Introduction

In this Net Stable Funding Ratio ("NSFR") Disclosure, "our," "we," "us," and "State Street" refer to State Street Corporation ("SSC") and "SSBT" refers to State Street Bank and Trust Company, SSC's principal banking subsidiary, each on a consolidated basis.

State Street Corporation is one of the world's leading providers of financial services to institutional investors, including investment services, markets and financing solutions and investment management. Our clients—asset managers and owners, insurance companies, wealth managers, official institutions, and central banks—rely on us to deliver solutions that support their business objectives across the investment life cycle.

The U.S. NSFR Disclosure Rule ("NSFR rule") requires certain large U.S. banking organizations, such as State Street and its bank subsidiaries, to maintain minimum amounts of Available Stable Funding ("ASF") to support their Required Stable Funding ("RSF") over a one-year time horizon. The NSFR is calculated by dividing the amount of ASF by the amount of RSF. ASF refers to the portion of an institution's regulatory capital and liabilities deemed to be stable funding sources over the time horizon considered by the NSFR, which extends to one year. An institution's RSF is a function of the liquidity characteristics and residual maturities of the various assets held by that institution as well as those of its off-balance sheet exposures. The minimum NSFR requirement is 100%.

The NSFR rule also requires us to publicly disclose certain qualitative and quantitative information related to our NSFR calculations and our liquidity management practices on a semiannual basis. Accordingly, we have developed this Disclosure, which contains the required public disclosures prepared in accordance with the NSFR rule and covering the quarterly periods from January 1, 2026 through March 31, 2026, and April 1, 2026 through June 30, 2026.

The NSFR rule requires us to present certain components of ASF and RSF on both a weighted and unweighted basis. For both components, the unweighted amount reflects the value of underlying items before ASF and RSF factors are applied, while the weighted amount reflects those values after applying the factors. Averages are calculated as simple averages of daily amounts over the calendar quarter.

NSFR Disclosure

NSFR Variance

SSC continues to maintain a daily NSFR above the 100% regulatory requirement. SSC's average daily NSFR decreased from 130% in the first quarter of 2026 to 128% in the second quarter of 2026. This decrease was primarily due to an increase of approximately $4.5 billion of RSF from loans and securities, partially offset by an increase of $3.6 billion in ASF due to operational deposit balances. SSBT is also subject to minimum NSFR requirements. SSBT's average daily NSFR was above the NSFR minimum requirements for both quarters.

We expect our average NSFR to vary from period to period due to business-as-usual fluctuations in our client activity, business mix, and the overall market environment.

Drivers of Quarterly Average NSFR

Client deposits are the main funding source for State Street and are the most significant driver of our NSFR. State Street provides custody and clearing solutions to a wide range of clients including asset managers, asset owners, insurance companies, official institutions, and central banks. These service relationships generate substantial operational deposit balances, which are generally considered to be a stable source of liquidity due to their importance to our clients' investment and related activities.

Available Stable Funding (ASF)

SSC's calculated weighted average ASF was $160 billion for the first quarter of 2026. Wholesale funding was the largest contributor of ASF with $108 billion ($99 billion in operational deposits and $8 billion in other wholesale funding). Capital and securities were the second largest contributor of ASF with $46 billion, comprised in roughly equal proportion of regulatory capital elements and other capital elements and securities. The remaining share of ASF was comprised of retail funding.

SSC's calculated weighted average ASF was $164 billion for the second quarter of 2026. Wholesale funding was the largest contributor of ASF with $111 billion ($103 billion in operational deposits and $8 billion in other wholesale funding). Capital and securities is the second largest contributor of ASF with $46 billion, comprised in roughly equal proportion of regulatory capital elements and other capital elements and securities. The remaining share of ASF was comprised of retail funding.

Required Stable Funding (RSF)

SSC's calculated weighted average RSF was $124 billion for the first quarter of 2026. Loans and securities were the largest contributor of RSF with $52 billion. The remaining components were comprised of HQLA, operational deposits placed at financial sector entities, undrawn commitments, and all other assets.

SSC's calculated weighted average RSF was $128 billion for the second quarter of 2026. Loans and securities were the largest contributor of RSF with $55 billion. The remaining components were comprised of HQLA, operational deposits placed at financial sector entities, undrawn commitments, and all other assets.

Quantitative Disclosure

The following tables presents further detail on the Firm's NSFR as required by the NSFR rule.

Liquidity Management

Governance

Global Treasury is responsible for our management of liquidity. This includes the day-to-day management of our global liquidity position, development and monitoring of early warning indicators and key liquidity risk metrics, creation and execution of liquidity stress tests, evaluation and implementation of regulatory requirements, maintenance and execution of our contingency funding plan ("CFP"), and routine management reporting to Asset Liability Committee ("ALCO"), Enterprise Risk Committee ("ERC") and the Risk Committee of the Board ("RC").

Global Treasury Risk Management, part of Enterprise Risk Management ("ERM"), provides separate oversight over the identification, communication and management of Global Treasury's risks in support of our business strategy. Global Treasury Risk Management reports to the Chief Risk Office ("CRO"). Global Treasury Risk Management's responsibilities relative to liquidity risk management include the development and review of liquidity risk policies and guidelines, and development and monitoring of limits related to adherence to the liquidity risk guidelines and associated reporting.

Liquidity Framework

We manage liquidity according to several principles that are equally important to our overall liquidity risk management framework:

- Structural liquidity management addresses liquidity by monitoring and directing the composition of our consolidated statement of condition. In addition, on a regular basis and as described below, our structural liquidity is evaluated under various stress scenarios.
- Tactical liquidity management addresses our day-to-day funding requirements and is largely driven by changes in our primary source of funding, which are client deposits. Fluctuations in client deposits may be supplemented with short-term borrowings, repurchase agreements, Federal Home Loan Bank ("FHLB") products and certificates of deposit.
- Stress testing includes internal and external liquidity stress testing to support our strategic liquidity risk management practices. Internal regular and ad hoc liquidity stress testing are performed under various severe but plausible scenarios at the consolidated level and at significant subsidiaries, including SSBT. These tests contemplate severe market and idiosyncratic events specific to us under various time horizons and severities. Tests contemplate the impact of material changes in key funding sources, credit ratings, additional collateral requirements, contingent uses of funding, systemic shocks to the financial markets and operational failures based on market and other assumptions specific to us. These stress tests evaluate the expected required level of funding versus available sources in an adverse environment. In addition to internal stress testing performed, we also monitor and perform regulatory stress testing through the LCR and NSFR. As stress testing contemplates potential forward-looking scenarios, results also serve as a trigger to activate specific liquidity stress levels and contingent funding actions.
- The CFP is designed to assist senior management with decision-making associated with any contingency funding response to a possible or actual crisis scenario. The CFP

defines roles, responsibilities and management actions to be taken in the event of deterioration of our liquidity profile caused by either an event specific to us or a broader disruption in the capital markets. Specific actions are linked to the level of stress indicated by these measures or by management judgment of market conditions.

Liquidity Risk Metrics

In managing our liquidity, we employ early warning indicators and metrics intended to detect emerging risks which may result in a liquidity stress, including changes in our stock price and spreads on our long-term debt. Additional metrics that are critical to the management of our consolidated statement of condition and monitored as part of our routine liquidity management include measures of our fungible cash position, purchased wholesale funds, unencumbered liquid assets, deposits and the total of investment securities and loans as a percentage of total client deposits.

Please see State Street's 2025 Form 10-K and our subsequent filings with the SEC for additional information.
